

ABSTRACT

An article of jewelry, such as a bracelet, contains twelve or twenty-four primary links, each having a visual representation that identifies an hour of the day. Each link is provided with a reminder mechanism, preferably a group of stones. One of the stones is selected for viewing in association with the primary link for the hour of the day that an act or event is desirably remembered. The selected stone is color-coded to represent an activity to be remembered, such as a meeting, a child pick-up, or telephone call or the priority associated with the event, e.g., urgent, important, can be rescheduled, etc. Since the selected stone of the reminder mechanism is associated with a given hour of the day, by correlating the selected stone to the primary link of the hour of the day of the event or act to be remembered, the wearer is reminded of the hour of an event sought to be remembered.
